

## LITENET flex-credit Function activation

Art. no. 22154449

On-demand upgrades for activating dormant functions in a LITENET system.

### Application

The LITENET lighting management system not only includes a number of basic functions but also dormant functions - such as daylight-based control of luminaires and blinds, or automatic monitoring of emergency luminaires - which can be activated on demand. A dormant function is activated as and when required by software-allocation of a suitable number of LITENET flex credits.

### Design notes

- The LITENET flex credits are allocated via the LITENET management software
- The credits allocated to the functions can be withdrawn again by the system manager and re-allocated as required within the same LITENET system.
- The number of LITENET flex credits required for activating a specific function depends on the type, operation and system of general and emergency lighting, blinds etc.
- Working out the number of LUXMATE flex-credits required:
  - a) at the advance design stage using a simple estimation
  - b) at a later stage e.g. using the LITENET software once the system is running, which displays how many "flex-credits" are needed for the upgrade.
- Minimum order quantity: 100
